**DETAILED ACTION**

***Response to Amendment***

1. Applicant's amendment filed on 10/4/10 has been entered.

Claims 1 - 10, is canceled.

Claims 22- 29 are new claims.

Claims 11- 29 are pending in the application.

***Response to Arguments***

2. Applicant's arguments filed on 10/4/10 have been fully considered and persuasive (see page 3- 6, of the remarks filed on 10/4/10. The rejection under 101, 112, second paragraph and 102 (b) is withdrawn and claims 11- 29 are now allowed.

***Reason For Allowance***

3. The following is an examiner's statement of reasons for allowance:

Claims 11-29 are allowed and renumbered as 1-19.

The prior art of record Hopper (US. 6,140,140) discloses manufacturing products, such as semiconductor chips, and more particularly, to a method and apparatus for detecting systematic pattern defects related to the manufacturing process. In fig 5, and col. 6, lines 1 - 65. In step 502, a first process is applied to a first part 420 of the wafer. In step 504, a second process is applied to a second part 422 of the wafer. The second process is similar, but different from the first process to determine the effects of varying a certain parameter associated with the first and second processes. Images of the first and second parts 420, 422 are then compared to each other by image subtraction (step 508). In Hopper, it is therefore clear that the surface of the wafer is

modified for the purpose of comparison. Hopper describes a comparison of two images taken from two different areas of the same wafer, where the two areas of the wafers have been exposed to different processes. In Hopper there is no comparison of an image of a wafer (i.e. a sawed piece of an ingot section) with an image of a solar cell wafer ( as recited in claim 11), a method for establishing correlation between wafers and solar cells produced from said wafers, where a wafer having a unique crystalline structure in provided in step a), and in step b) an image is captured of the wafer with an imaging device, said imaging device being arranged to render images of sufficient resolution to enable identification of the wafer's crystalline structure. This image is compared with an image captured of a solar cell manufactured from the wafer in step a). This is not known from Hopper - Hopper describes a comparison of two images taken from two different areas of the same wafer, where the two areas of the wafers have been exposed to different processes (as recited in claim 22), a method for the production of solar cells where wafers having a unique crystalline structure is cut from an ingot. As described above, an image is captured of the wafer with an imaging device, said imaging device being arranged to render images of sufficient resolution to enable identification of the wafer's crystalline structure. This image is compared with an image captured of a solar cell manufactured from the wafer in step a). This is not known from Hopper - Hopper describes a comparison of two images taken from two different areas of the same wafer, where the two areas of the wafers have been exposed to different processes (as recited in claim 27) as commonly included in the independent claims 11, 22 and 27), the prior art of record fails to teach either singularly or in combination, fails

to anticipate or render the above limitations obvious. Claims 11- 29 have been withdrawn from the rejection and are allowed.

4. Any comments considered necessary by applicant must be submitted on later than the payment of the issue fee and to avoid processing delays should preferably accompany the issue fee. Such submissions should be clearly labeled, comments on statement of reasons for allowance.
